Can photovoltaic and biogas be integrated in a WWTP?

Integrating renewable energy sources, biogas, and solar energy could provide up to 88% of the annual energy requirements of WWTPs. Recommendations are provided for further research considering the limited availability of integrated resources for studying the simultaneous utilization of photovoltaic and biogas systems.

1. Introduction

Is solar photovoltaics sustainable?

Solar photovoltaics is a common solar technology that has a high potential to meet global energy demand and significantly impacts the transition to sustainable energy by reducing carbon emissions from WWTPs by 10%-40%. However, solar PV deployment requires expansive land areas (Chen and Zhou, 2022; Claus and Lpez, 2022).

Can a hybrid system reduce costs for a medium-sized WWTP?

Consequently, the design of a hybrid system with a biomass gasifier, solar energy, and power grids can reduce costs for a medium-sized WWTP, and the use of a hybrid system combining multiple energy sources could be a technically and economically viable alternative for use at medium-sized WWTPs (Buller et al., 2022).

How much electricity is needed to power a wastewater treatment plant?

The electricity needed to power a WWTP is typically 0.3-0.6 kW·h/m³. In contrast, the thermal energy produced from the combustion of organic compounds in wastewater is generally nine to ten times higher than the electricity for powering a WWTP. Recovering chemical energy from wastewater is financially advantageous.
