This article reviews the profound role that meridional circulation plays in maintaining global dynamics and regulating large-scale solar magnetism.

A solar model describes the structure of the Sun's interior. Specifically, it describes how pressure, temperature, mass, and luminosity depend on the distance from the center of the Sun.

Energy is generated in the core, the innermost 25%. This energy diffuses outward by radiation (mostly gamma-rays and x-rays) through the radiative zone and by convective ...

A solar internal circulation switch primarily regulates the flow of heated water within solar thermal systems. Its key functionality includes ...

There are two types of models of the solar interior: (1) hydrostatic equilibrium models and (2) time-dependent numerical simulations of the evolution of the Sun, starting from an initial gas cloud ...

The article provides an overview of solar water heating systems, discussing their efficiency in utilizing solar energy and the matured technology developed over 100 years. It covers types of ...

When the solar panels absorb sunlight, they generate heat, which is transferred to the circulating fluid. The pump's role is to maintain a consistent flow, regulating temperature ...
