Energy storage is mainly divided into three camps: power supply side, grid side and user side, each of which has unique functions and characteristics.

3. Energy storage technologies encompass a diverse array of methods, including mechanical, electrical, and chemical technologies. 4. ...

Any electrical power grid must match electricity production to consumption, both of which vary significantly over time. Energy derived from solar and wind sources varies with the weather on time scales ranging from less than a second to weeks or longer. Nuclear power is less flexible than fossil fuels, meaning it cannot easily match the variations in demand. Thus, low-carbon electricity without storage presents special challenges to electric utilities.
